

Module 6 Lesson 4

Try This 4 – 8 Possible Solutions

TT 4. In each case, we need to write an equation representing the data or the situation. To do this, we need to first determine the slope. In both cases, we are then expected to substitute values into the equation to solve a problem.

TT 5. The following is a key phrase that is common among the questions that are posed: “Write an equation that models . . .”

TT 6. a. The question is structured in the following way:

- Generate data.
- Write an equation.
- Use the equation by substituting given values.

b. The parts are arranged in the following order:

- Data generation.
- Equation generation.
- Value generation.

TT 7. Each part builds on the previous part.

TT 8. You needs to remember how to find the slope of an equation. We will also need to know how to evaluate a formula or equation.
