

**Determining if a Triangle has a Right Angle Practice**

1. Is the triangle shown a right triangle?

**Step 1:** Label the sides of the triangle.

**Step 2:** Calculate the square of the longest side.

The longest side,  $c$ , is 35 units long.

$$c^2 = 35^2$$

$$= 1225 \text{ square units}$$

**Step 3:** Calculate the sum of the squares of the other 2 sides.

The other two sides,  $a$  and  $b$ , are 21 units and 28 units long.

$$a^2 + b^2 = 21^2 + 28^2$$

$$= 441 + 784$$

$$= 1225 \text{ square units}$$

Because both sides of the equation are 1225 square units, the triangle is a right triangle.

**Alternate Solution**

$$a^2 + b^2 = c^2$$

$$21^2 + 28^2 = 35^2$$

$$441 + 784 = 1225$$

$$1225 = 1225$$

*Because both sides of the equation are 1225 square units, the triangle is a right triangle.*

2. Is the triangle shown a right triangle?

**Step 1:** Label the sides of the triangle.

**Step 2:** Calculate the square of the longest side.

$$c = 13 \text{ cm}$$

$$c^2 = 13^2$$

$$c^2 = 169 \text{ cm}^2$$

**Step 3:** Calculate the sum of the squares of the other 2 sides.

$$a = 12 \text{ cm and } b = 6 \text{ cm}$$

$$a^2 + b^2 = 12^2 + 6^2$$

$$= 144 + 36$$

$$= 180 \text{ cm}^2$$

*This is not a right triangle because  $169 \text{ cm}^2$  and  $180 \text{ cm}^2$  are not the same.*

**Alternate Solution**

$$a^2 + b^2 = c^2$$

$$12^2 + 6^2 = 13^2$$

$$144 + 36 = 169$$

$$180 \text{ cm}^2 \neq 169 \text{ cm}^2$$

*This is not a right triangle because  $169 \text{ cm}^2$  and  $180 \text{ cm}^2$  are not the same.*
